**Observer:** Jouel B. Taggug.  
**Photograph by:** Jouel B. Taggug.  
**Subjects identified by:** Emerson Y. Sy.

**Location:** Barangay San Juan, Municipality of Cabagan, Isabela Province, Luzon Island, Philippines.  
**Elevation:** 49 metres.  
**Habitat:** Agricultural land.  
**Date and time:** 25 October 2017, 12:30 hrs.

**Identity of subject:** Northern Philippine Cobra, *Naja philippinensis* (Reptilia: Squamata: Elapidae).

**Description of record:** Two adult Northern Philippine Cobra exhibiting uniform dark grey colouration (Fig. 1) were found hiding underneath a pile of sacks and were subsequently killed by residents by striking the head and body with wooden sticks.

**Remarks:** The elapid snakes were identified as *Naja philippinensis* based on (i) loreal scale is absent (ii) three postoculars, (iii) one preocular, and (iv) 21 scale row at midbody (Taylor, 1922).

*Naja philippinensis* is a spitting cobra endemic to the Philippines which occurs on the following islands: Catanduanes, Lubang, Luzon, Mindoro, Marinduque and Masbate (Sy and Balete, 2017; Sy and Vargas, 2017). The typical dorsal body colour is uniform light brown to olive brown (Taylor, 1922; Leviton, 1965), but individuals exhibiting melanism from uncertain localities have been observed at a government wildlife rescue center (Sy, pers. obs.) and in captivity at the antivenom production facility of the Research Institute for Tropical Medicine (A. Diesmos, pers. comm.). This note provides a locality of naturally occurring melanistic *Naja philippinensis*.
